U.S. Model
AEP Model
UK Model

FM STEREO TUNER

SPECIFICATIONS

GENERAL

System:	PLL crystal-locked digital synthesizer system
Power Requirements:	US model 120 V ac, 60 Hz AEP, UK model 110, 120, 220 or 240 V ac adjustable, 50/60 Hz
Power Consumption:	US model: 20 W AEP, UK model: 18 W
Dimensions:	Approx. 430 (w) x 80 (h) x 315 (d) mm 17 (w) x 3 1/4 (h) x 12 1/2 (d) inches including projecting parts and controls
Weight:	US model Approx. 4.6 kg (10 lb 2 oz) net Approx. 5.4 kg (11 lb 15 oz) in shipping carton AEP, UK model Approx. 4.8 kg (10 lb 10 oz) net Approx. 5.6 kg (12 lb 6 oz) in shipping carton

TUNER SECTION

Tuning Range:	87.5 MHz — 108 MHz
Antenna Terminals:	300 Ω, balanced 75 Ω, unbalanced coaxial input
Intermediate Frequency:	10.7 MHz
Sensitivity at 50dB Quieting:	16.8 dBf, 3.8 μV (mono) (US model) 37.3 dBf, 40 μV (stereo)
Sensitivity at 46dB Quieting:	3.8 μV (mono) (40kHz deviation) (AEP, UK model) 40 μV (stereo)
Usable Sensitivity:	US model 10.8 dBf, 1.9 μV AEP, UK model 1.4 μV (S/N = 26 dB, 40 kHz deviation) 1.9 V, 10.8 dBf (IHF)
Limiting Threshold:	(AEP, UK model) 1.2 μV

Handling Precautions for MOS ICs

Generally, the insulation resistance of the oxide layer in MOS IC structures is very high, and the oxide layer is very thin. Because of this, it is possible that the static voltages usually present on clothes and the human body will be enough to generate a potential difference across the insulator, high enough to cause a breakdown of the insulating layer.

The following precautions should be taken while handling these ICs.

(Particular care should be taken under conditions of low humidity.)

Precautions in Replacing MOS ICs

1. Store new ICs by inserting them into a urethane-polyester cushion (which is somewhat conductive), or wrapping it in aluminum foil, so that all the pins are at the same potential. (The ICs should be stored in that manner until mounted on the circuit board.)

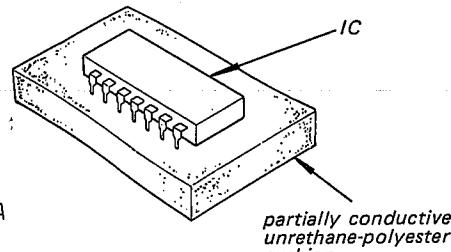

Fig. A

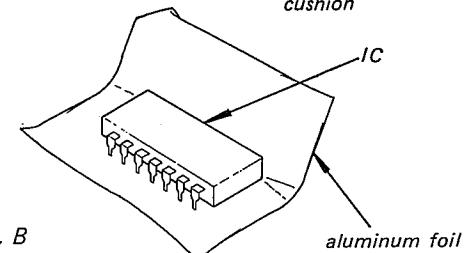

Fig. B

2. Check the soldering iron for possible power-line leakage current. Make sure that there is no leakage path by connecting an ohmmeter to the tip of the soldering iron and the plug as shown in Fig. C. If there is a leakage path, use some other soldering iron.

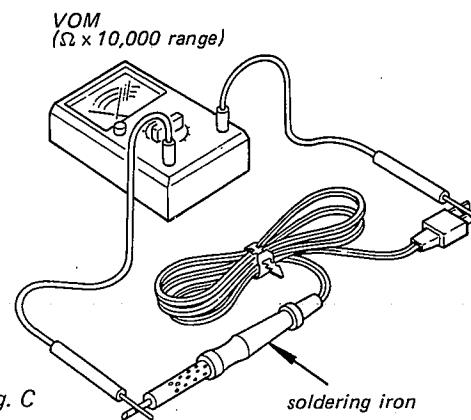

Fig. C

3. Equalize any potential difference between the clothes, the tools in use, the work bench, the set being worked on, and the packaged IC by touching them all in succession with the hands or a conductive wire or tool.
4. The following are effective methods for handling ICs that remove the potential difference across the oxide layer.
 - Use a paper clip modified by soldering in a wire braid insert.

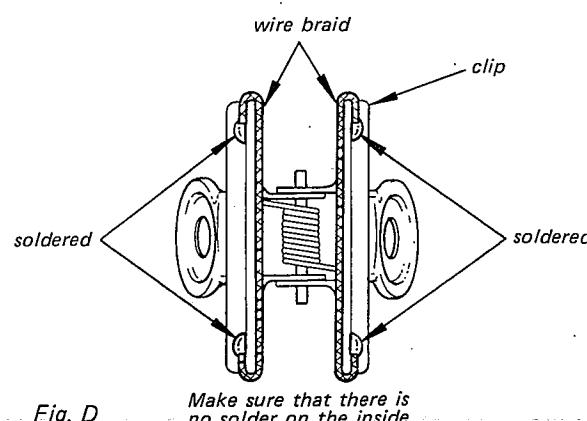

Fig. D

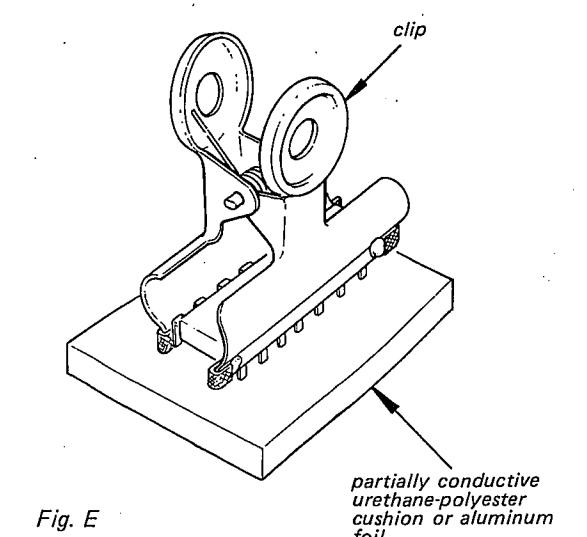

Fig. E

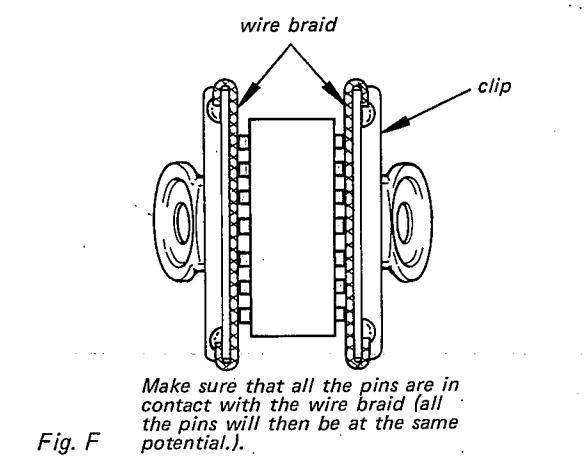

Fig. F

- Take a short length of fine bare wire and wind it around the IC so that it shorts all the pins of the IC, while it is still in the urethane-polyester cushion or aluminum foil. This ensures that all the pins are at the same potential.

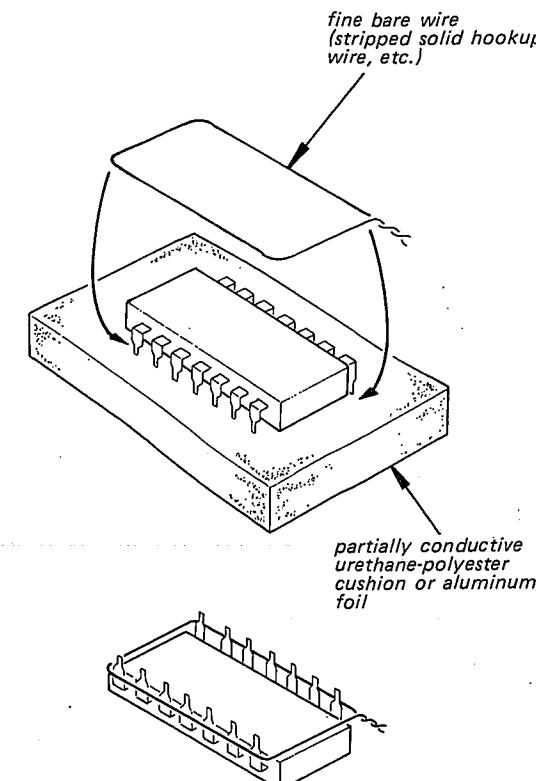

Fig. G

- When it is necessary to handle the IC with the fingers, do not touch any pin, and hold the IC at the ends of its plastic-package case as shown in Fig. H.

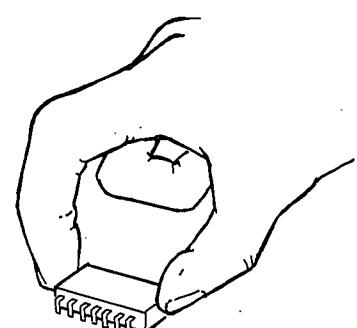

Fig. H

5. Method of Mounting

Insert the IC while holding it with the modified clip, and solder all the pins with the clip still shorting the pins. (Similarly, solder all the pins while the bare shorting wire is still wound around them.). Remove the clip or the bare shorting wire only after all the pins have been soldered.

Precaution while Checking C-MOS ICs

The C-MOS ICs (Complementary MOS) are MOS ICs that have their output sections made up of N-channel and P-channel push-pull stages to increase their speed of operation. If the output terminal of these ICs comes into contact with B+ or B- voltage, then the FET which is ON at that time will either become shorted or open.

This is valid for all the output sections that are connected together by the interconnections. Even the circuits that are physically separated (and not on the same board) can be destroyed simultaneously.

Example:

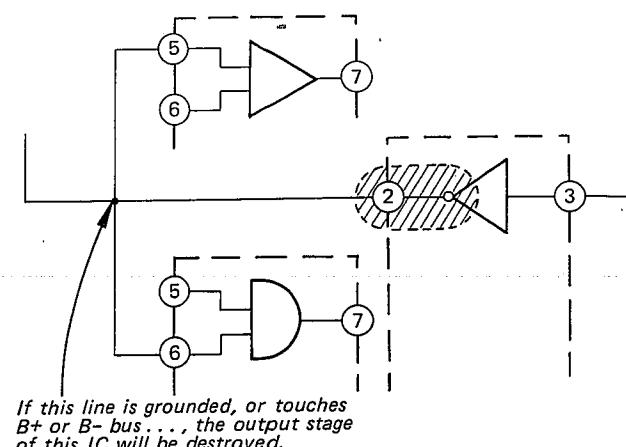

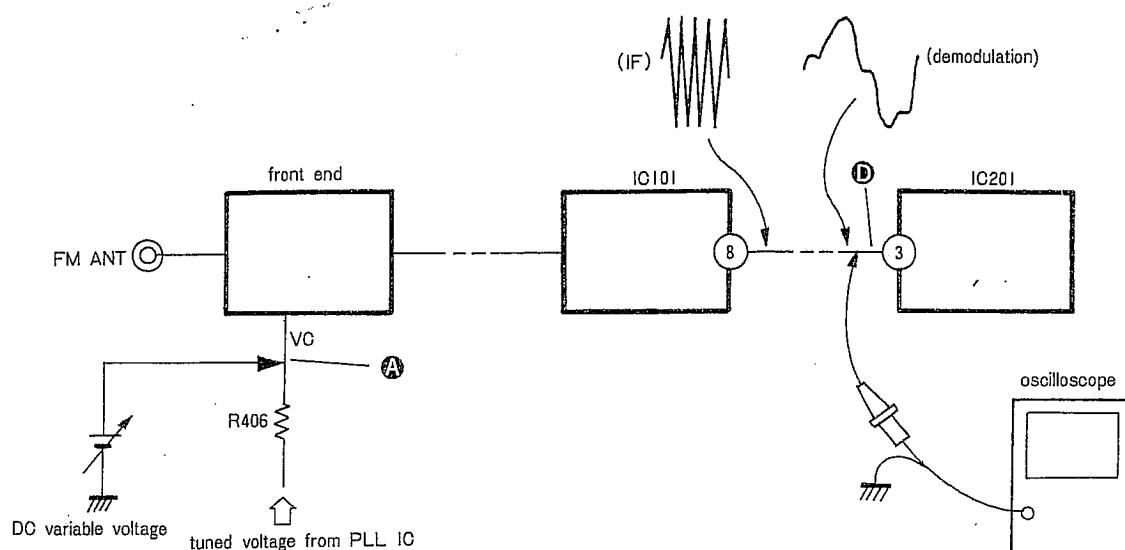

Fig. I

SECTION 1

OUTLINE

1-1. CIRCUIT DESCRIPTION

TROUBLE CHECKS FOR FM RECEPTION

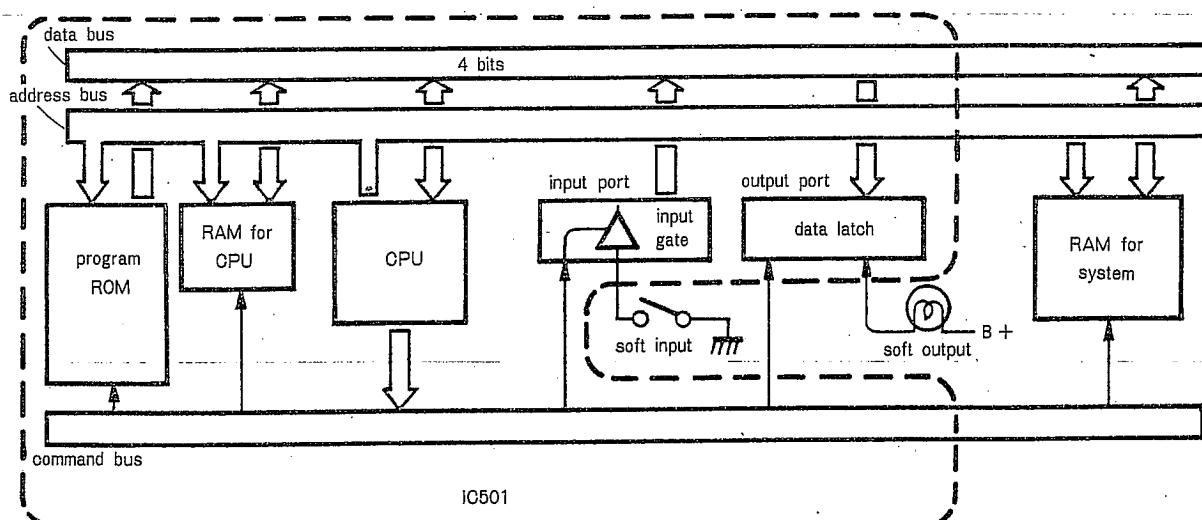

When FM signal can not be received, make above connection. Regardless of the computer or the PLL synthesizer, trouble checks for FM reception can be made.

How to Check

1. Connect an oscilloscope or an earphone with point ①.
2. Check whether there is noise or broadcast on an oscilloscope or through an earphone.
3. Make sure that stations can be received one after another when changing DC variable voltage from approximately 0V to 20V.

 μ PD533C-073 (IC501)

IC501 (μ PD553C-073) is a one-chip microcomputer. Configuration of the computer system is shown below.

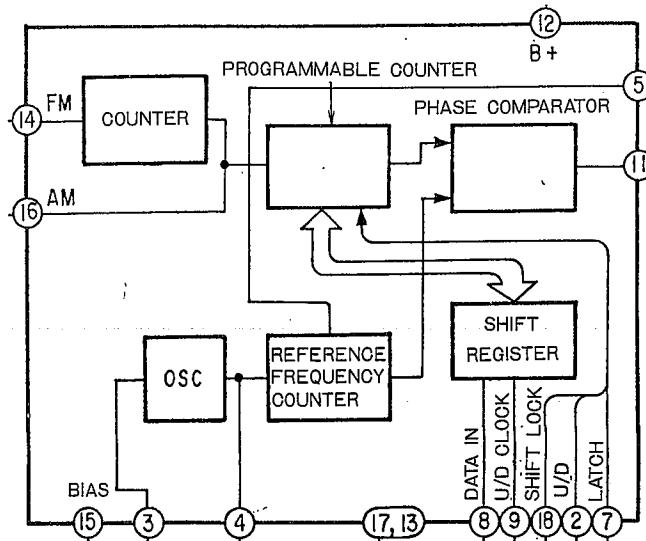

Above figure is an example of the computer system composed by six individual ICs. μ PD553C has functions of ICs surrounded by the broken line. In the above figure there is only one pair of I/O ports and I/O can be made in four-bit parallel manner. This set has nine pairs of the ports each of which is four bits except one port which is three.

RAM on the far right is the memory capable of presetting up to 8 stations and maintains the memorized information for a long time without a battery back-up after the power switch is turned off. Suffix of IC501, that is 073, shows that the program for ST-J75 has already been written in IC501.

CX778 (IC401)

IC401 is the PLL synthesizer to control local oscillator frequency by comparing it with reference frequency. As the local oscillator output is directly (without any additional prescaler) supplied to the programmable counter section, reference frequency is as high as the channel spacing frequency. The benefits owing to this are the stable and almost ripple-less local oscillation and reduced spurious radiation.

As shown above, the programmable counter for changing frequency gets the data through the shift register.

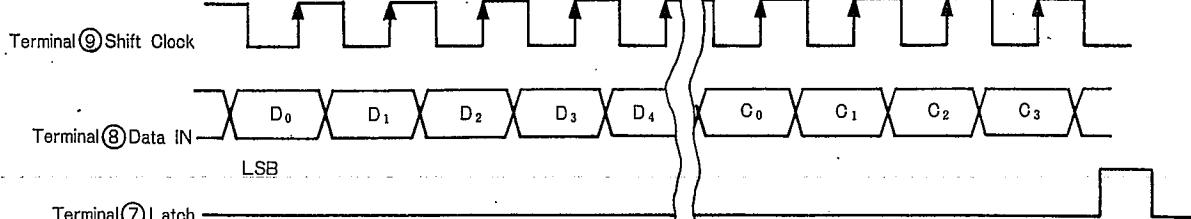

Data Input Procedure from Microcomputer:

• Setting of division ratio

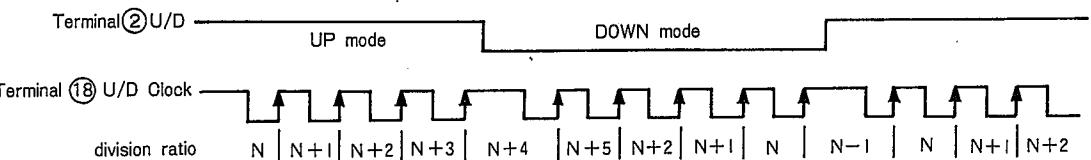

Data for setting division ratio of the programmable counter, comparison frequency and the pin for input are input by 16-bit serial manner by using terminals DATA IN, SHIFT CLOCK and LATCH. The first 12 bits ($D_0 - D_{11}$) of this 16-bit data works for

Function of Terminals

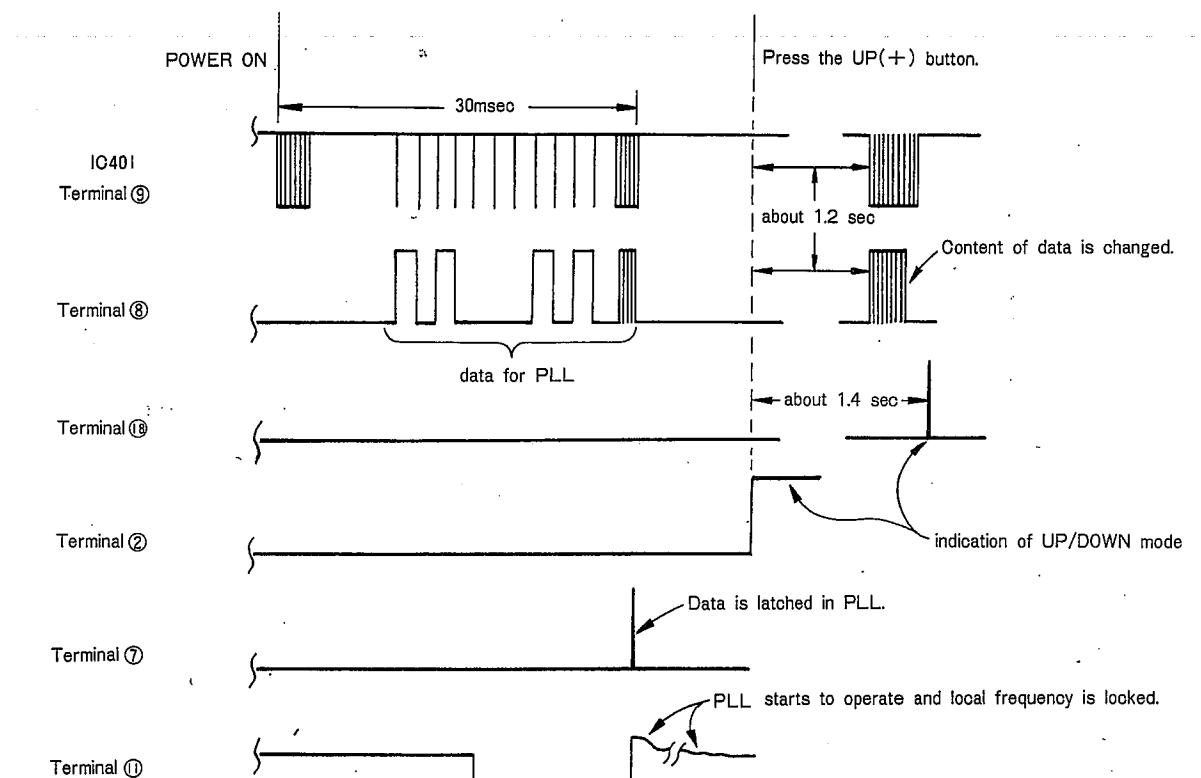

Pin No.	Mark	Function
1	Data Check	not used in this set
2	U/D	input terminal for selecting mode of built-in UP/DOWN counter HIGH level: UP mode LOW level: DOWN mode
3, 4	X ₁ , X ₀	terminal for connecting crystal oscillator (7.2MHz)
5	Sys CLK	output terminal for system clock in phase comparator 360kHz
6	Fref	output terminal for reference frequency
7	Latch	input terminal for signal to let the shift register latch the data Data is latched at HIGH level
8	Data IN	input terminal for data
9	Shift CLK	input terminal for clock to let data input in 16-bit parallel manner
11	PD	output terminal for phase comparator (tristate)
12	VDD	power supply (+5V)
13	Fout	output terminal for divided signal from the programmable counter
14	FM IN	input terminal for signal from FM local oscillator
15	Sub GND	substrate ground
17, 18	U/D CLK	input terminal for UP/DOWN clock of UP/DOWN counter

• Input waveform of UP/DOWN pin is as follows.

Each terminal receives instructions from the CPU which are expressed with the combination of "0" and "1". There is no meaning in measuring waveform at each terminal with an oscilloscope, because combination of "0" and "1" changes every moment without any rule. Few examples are shown below.

MEMORY IC CX761 (IC502)**Outline of CX761:**

- (a) This is a non-volatile memory IC. Has 260 (16 words x 16 bits + 4 bits) non-volatile memory transistors built in, and works for reading, erasure and writing the data word.
- (b) Because of being a non-volatile type memory, this IC maintains the memorized informations for a long time without a battery back-up after the power switch is turned off.
- (c) Word address is done by the BCD inputs.
- (d) Silicon-type P-channel enhancement NMOS IC construction.
- (e) 14-pin molded DIP casing.

Function of Terminals:

Terminal	IN or OUT	Function
1	IN	Word address D
2	IN	Word address C
3	IN	Word address B
4	IN	Word address A
5	IN	Power supply input
6	IN/OUT	Writing and erasure control inputs/memory-BUSY output
7	IN	Power supply input
8	IN/OUT	Inputs and outputs for test checkout
9	IN	Test signal
10	IN/OUT	Combined data inputs and data outputs
11	IN	Input for synchronous clock
12	IN	Input for mode control C3
13	IN	Input for mode control C2
14	IN	Input for mode control C1

Mode Control Signals

MODE INPUT	SB	RTNS	WTNS	WRT	MSTNS	ERS	READ	MCTNS
C1	0	1	0	1	0	1	0	1
C2	0	0	1	1	0	0	1	1
C3	0	0	0	0	1	1	1	1

Note:

SB: Standby

RTNS: Informations of the data register (relayed by the READ operation) are put out from the D I/O terminal

WTNS: Informations to be memorized are relayed to the data register from the D I/O terminal

WRT: Memorize the informations relayed by the WTNS operation in the designated address

ERS: Clears the informations memorized in the designated address

READ: Relay the memorized informations in the designated address to the data register

MSTNS: The control signals which follow the MSTNS operation are processed in accordance with the station memory

MCTNS: The control signals which follow the MCTNS operation are processed in accordance with the last channel memory.

IC504 (4 bits x 4 latch)

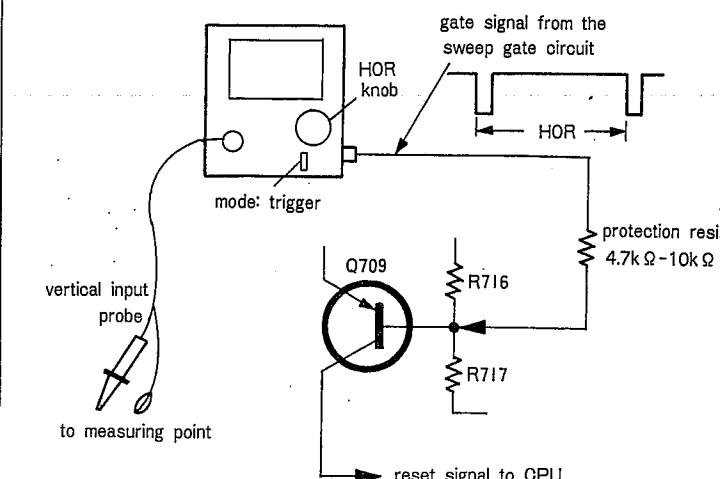

There are 4 ports for latching each of which can receive command from the CPU. The port selector signal from the CPU selects which port receives the command.

Display Function of Microcomputer

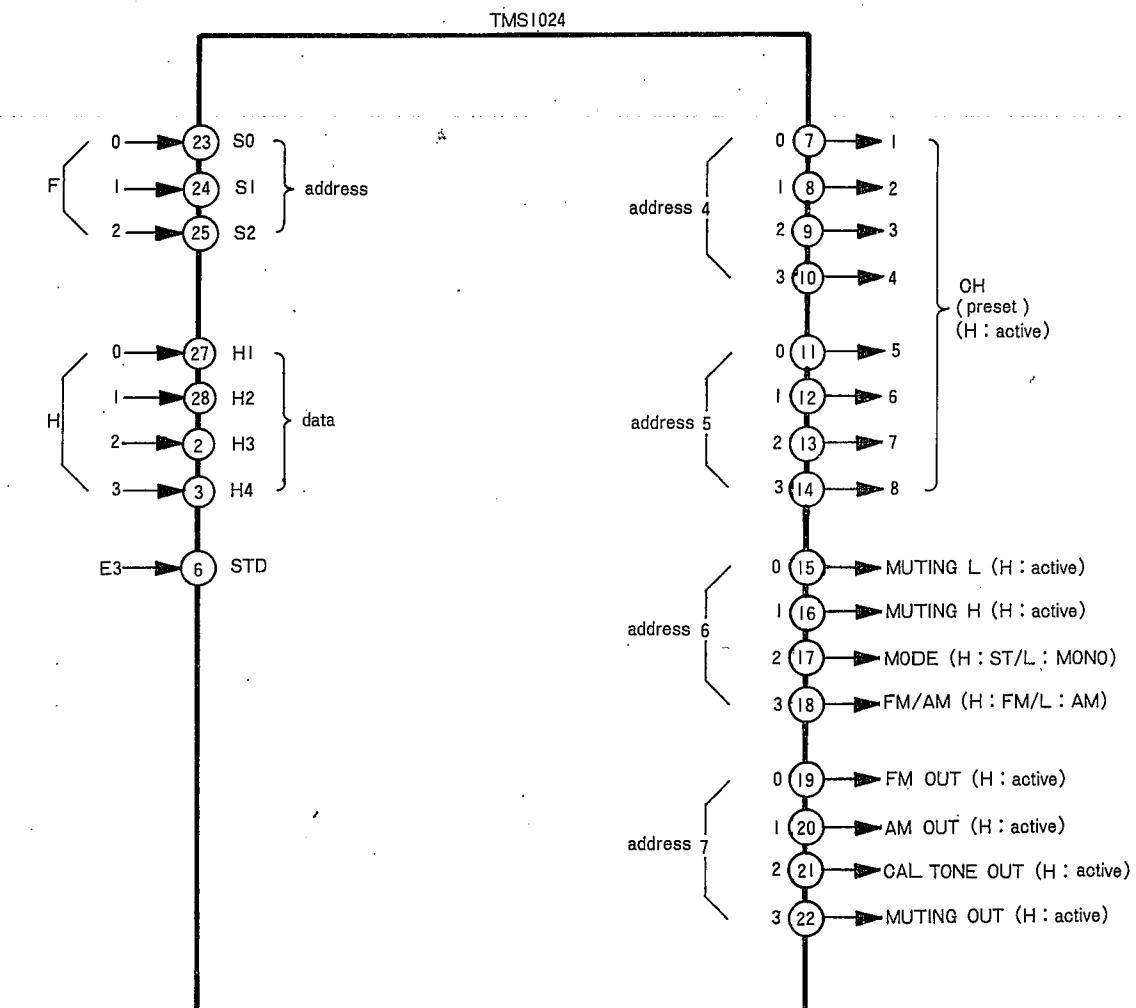

The display of this set is the dynamic light-up system which is made by the digit and the data for a segment from the CPU.

How to Check the Microcomputer with an Oscilloscope

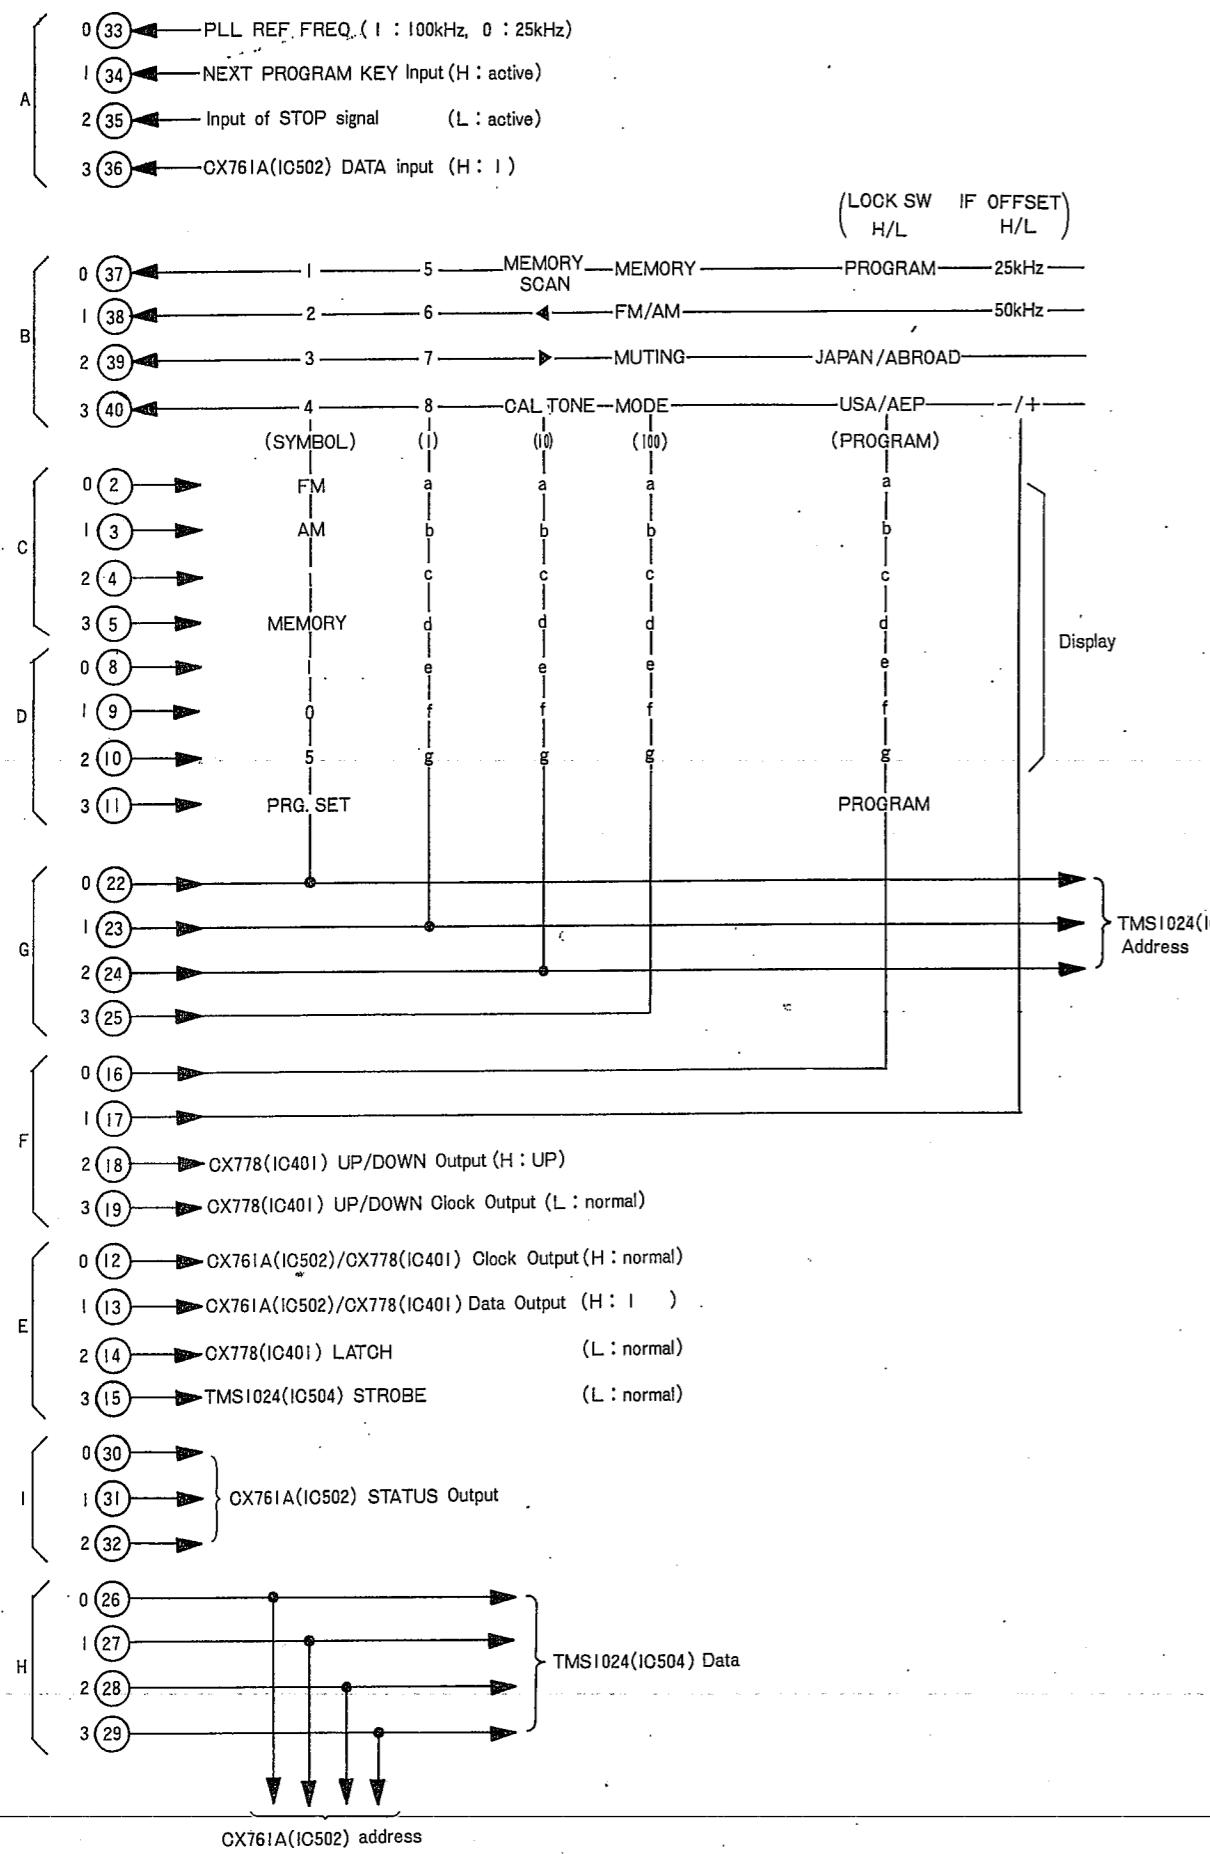

When a microcomputer is in normal condition, programs in the CPU are executed in a certain sequence when the power switch turns on. This is owing that the ROM program is written in. Following check can be made according to the above mentioned logic.

**How to Check**

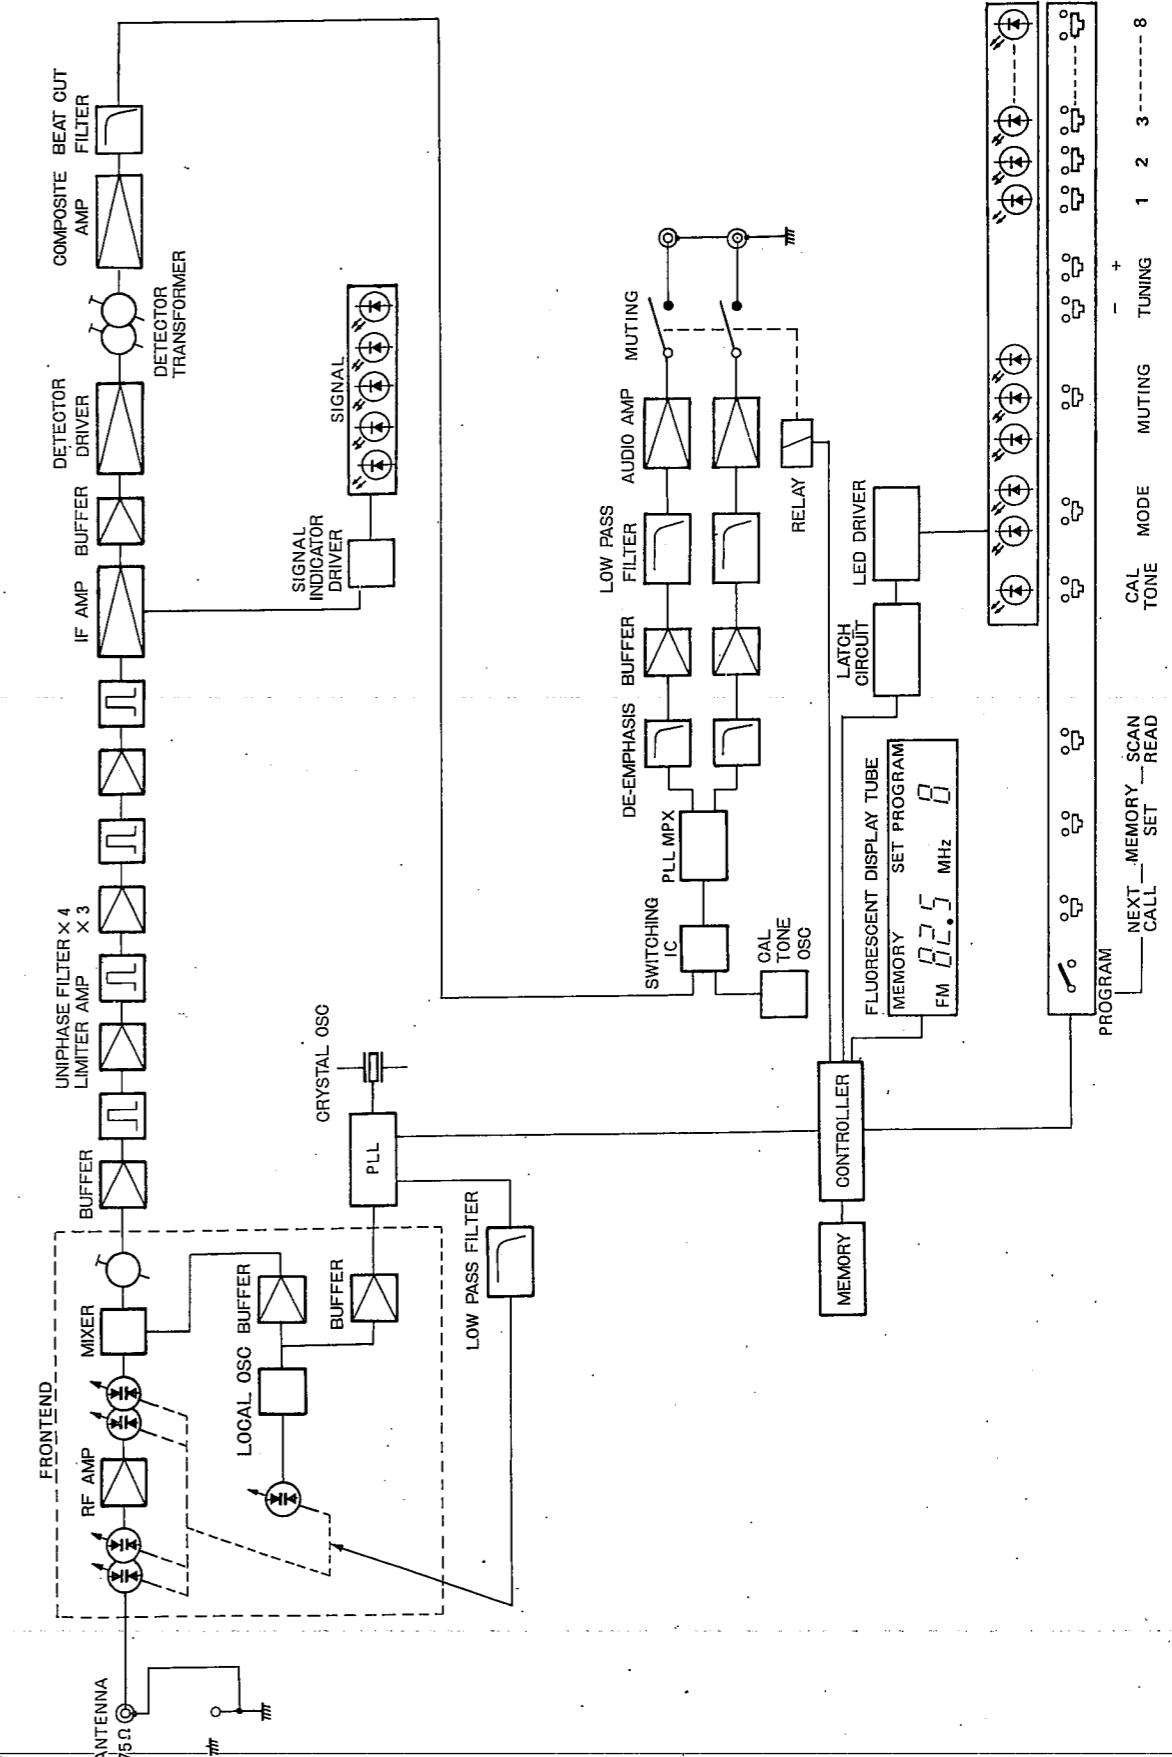

- Connect the gate output of an oscilloscope with Q709 via a protection resistor. When the oscilloscope is turned on, the CPU starts.
 - oscilloscope: free running (that is, trigger mode: AUTO)
 - HOR of oscilloscope: 5msec DIV
- If necessary, measure each section with a probe. (The fact that the frequency is displayed on the frequency counter means that a microcomputer is in normal condition, because frequency display is made after finishing every preparation.)

Input and Output of TMS 1024 (IC504)

Input and output of μ PD553C-073

1-2. BLOCK DIAGRAM

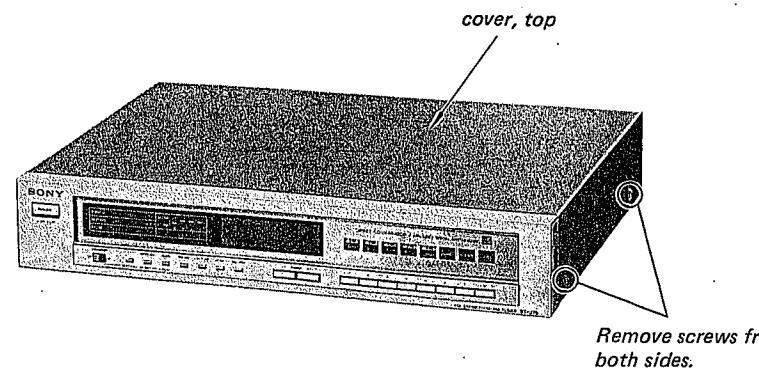

SECTION 2 DISASSEMBLY

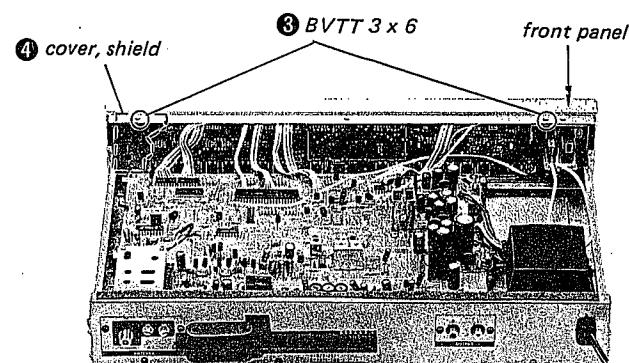

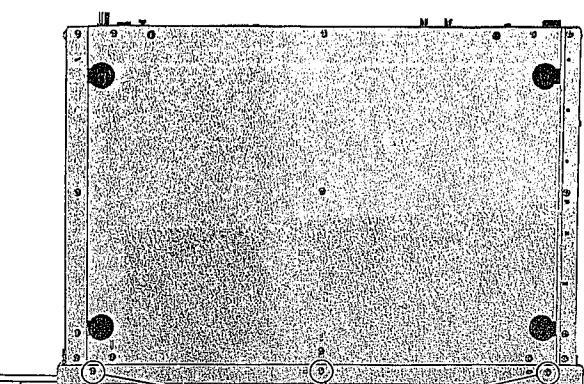

Note: Follow the disassembly procedure in the numerical order given.

FRONT PANEL

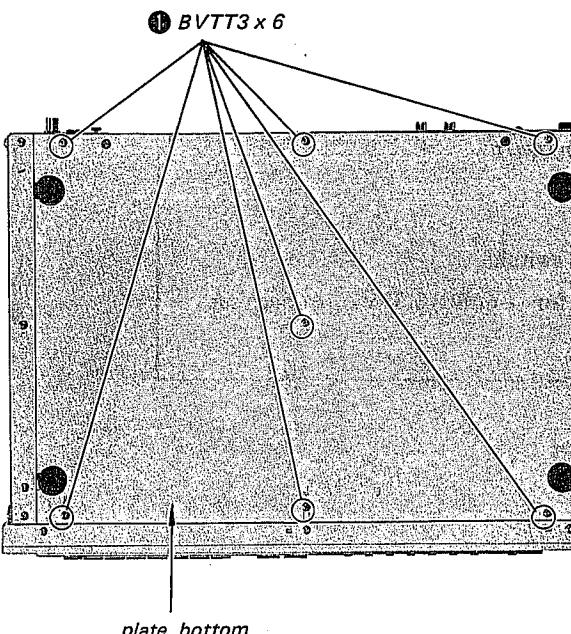

when front panel is removed:

when sub-chassis is removed:

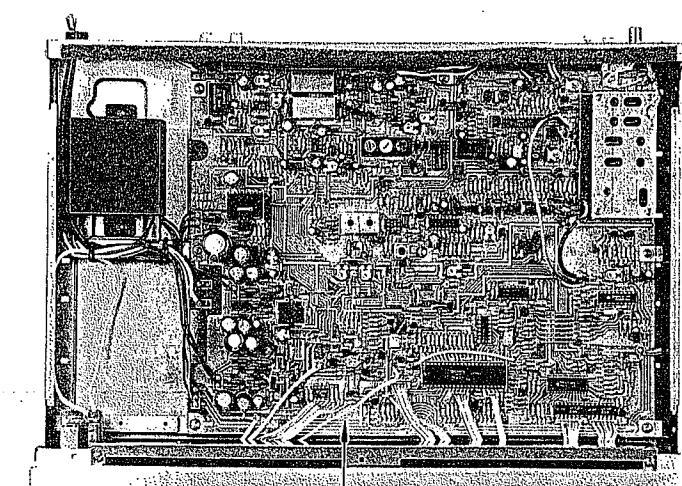

BOTTOM PLATE

TUNER BOARD

Component side of tuner board can be checked and adjusted after removing bottom plate.

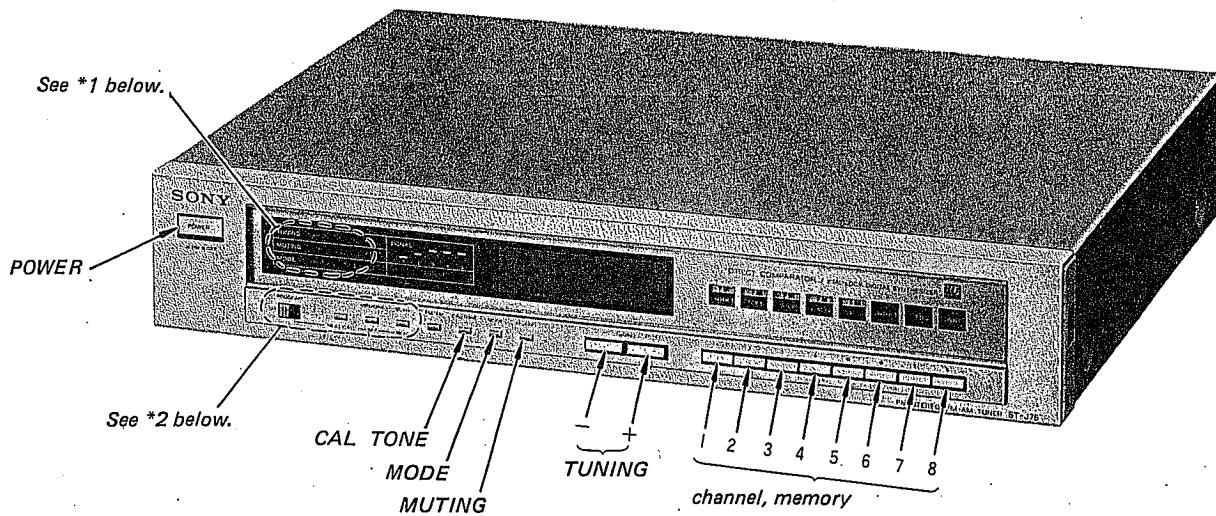

SECTION 3 ADJUSTMENTS

3-1. ELECTRICAL ADJUSTMENT

- Before Adjustments

PROGRAM switch: OFF

POWER switch: ON

* 1

TUNING	MANUAL	AUTO	AUTO
MUTING	OFF	LOW	HIGH
MODE	AUTO STEREO		

Each time MUTING switch is pressed,
indication changes in sequence.

Each time MODE switch is pressed, indication "AUTO" lights
up or goes off. When SCAN button is pressed, "AUTO" goes
off.

* 2

Within three seconds after pressing MEMORY button,
press preset buttons to memorize stations in preset
buttons.

NEXT CALL

SET

READ

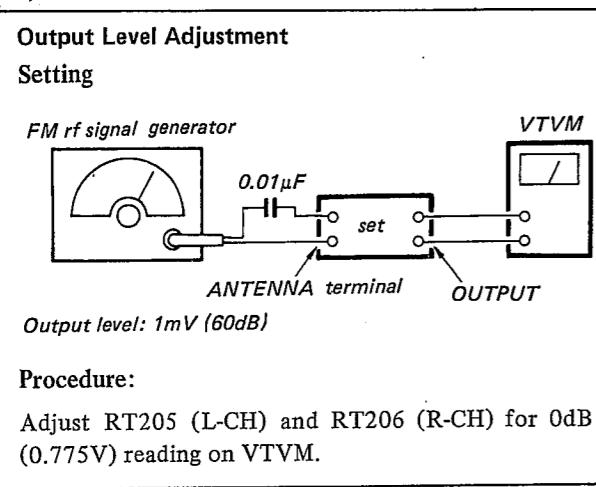

When NEXT CALL switch is
pressed, the indication of
the next programmed station
flashes while the station
being received continues to be
turned on.

Press SET switch to program
stations which will be received
each time when power is on.

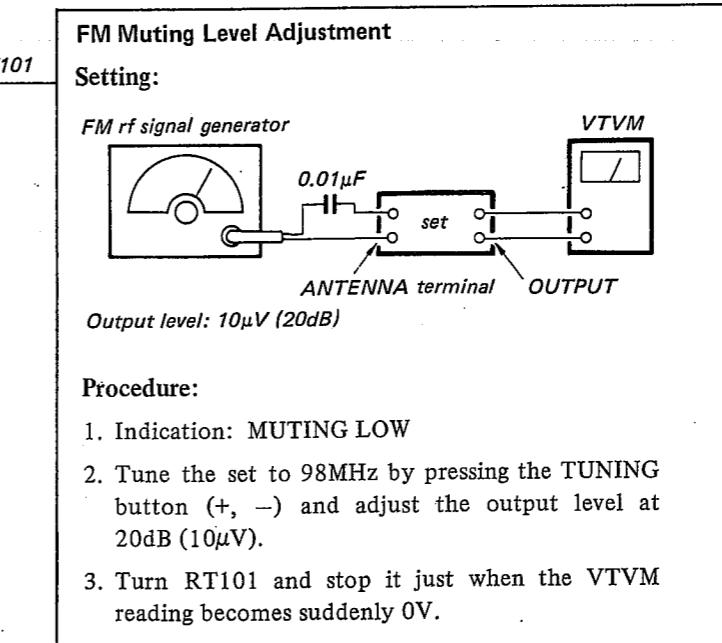

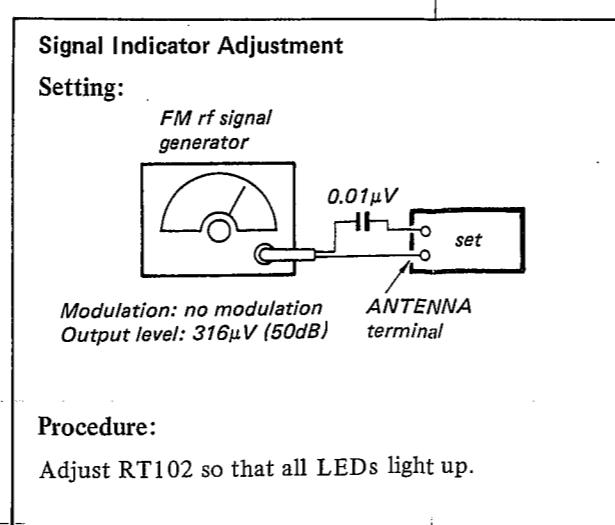

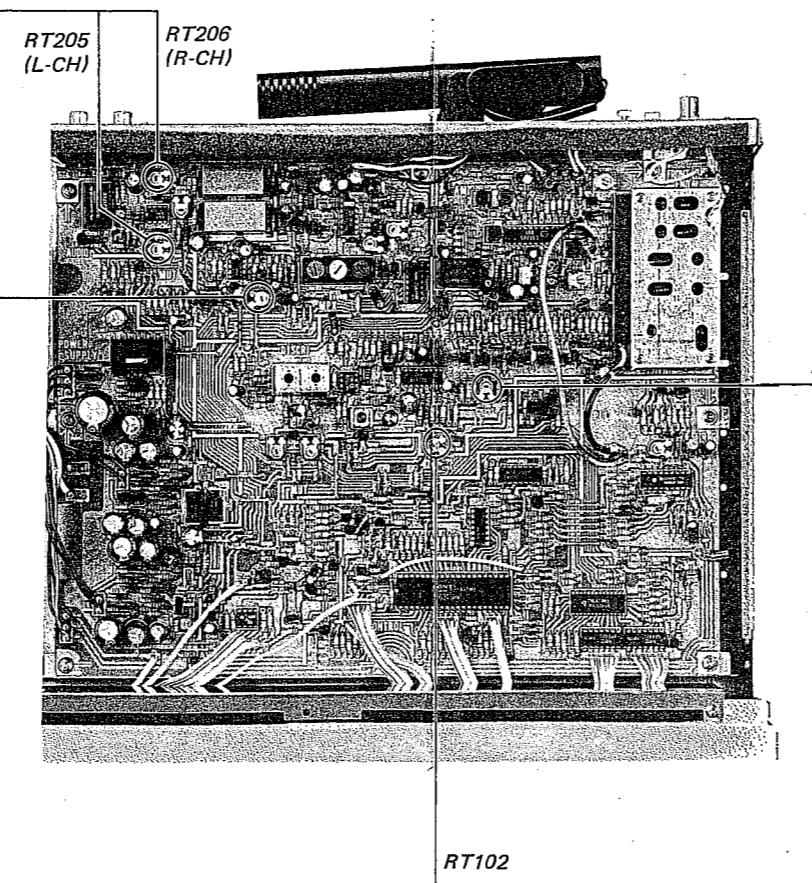

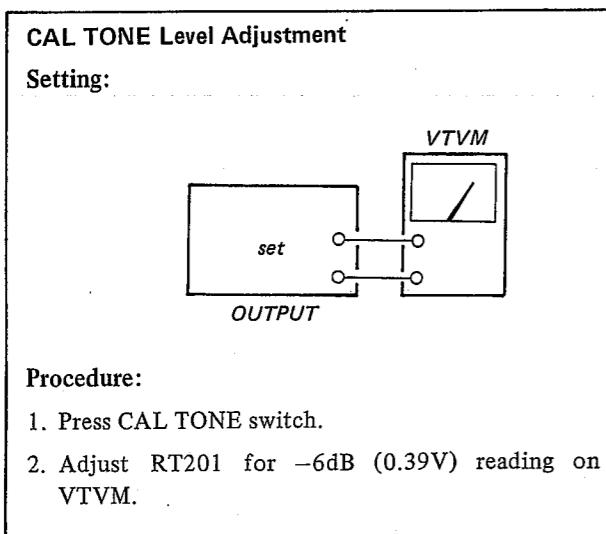

Press READ switch to confirm
the sequence of programmed
stations.

When SCAN switch is pressed,
stations prememorized on
the station preset buttons are
received in sequence (from left
to right) each for 3.5 seconds.

FM SECTION 1

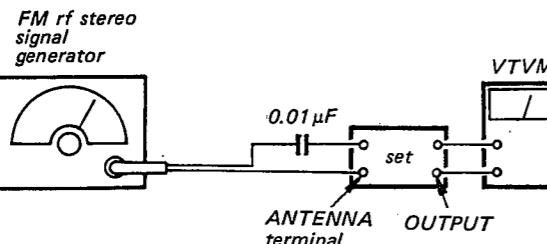

FM rf Stereo Signal	FM rf Monaural Signal
Carrier frequency: 98MHz Modulation: Audio 400Hz, 33.75kHz deviation (45%) Subchannel 38kHz 33.75kHz deviation (45%) Pilot 19kHz 7.5kHz deviation (10%)	Carrier frequency: 98MHz Modulation: 400kHz deviation (100%)

FM SECTION 2

Stereo Separation Adjustment

Procedure:

Carrier frequency: 98 MHz
Output level: 1mV (60 dB)

Mode: Stereo

Modulation:
Audio (400 Hz): 33.75 kHz deviation (45%)
Pilot (19 kHz): 7.5 kHz deviation (10%)
Subchannel (38 kHz): 33.75 kHz deviation (45%)

FM stereo signal generator output channel	VTVM connection	VTVM reading (dB)
L-CH	L-CH	(A)
R-CH	L-CH	(B) Adjust RT204 for minimum reading.
R-CH	R-CH	(C)
L-CH	R-CH	(D) Adjust RT204 for minimum reading.

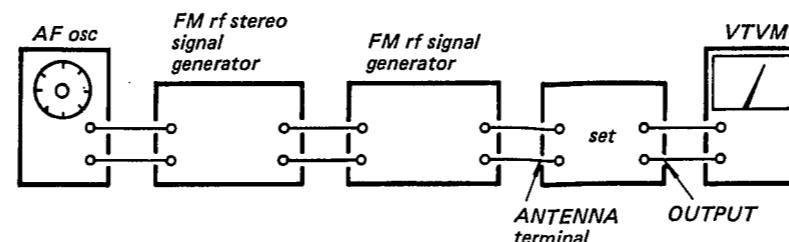

L-CH Stereo separation: (A) - (B)

R-CH Stereo separation: (C) - (D)

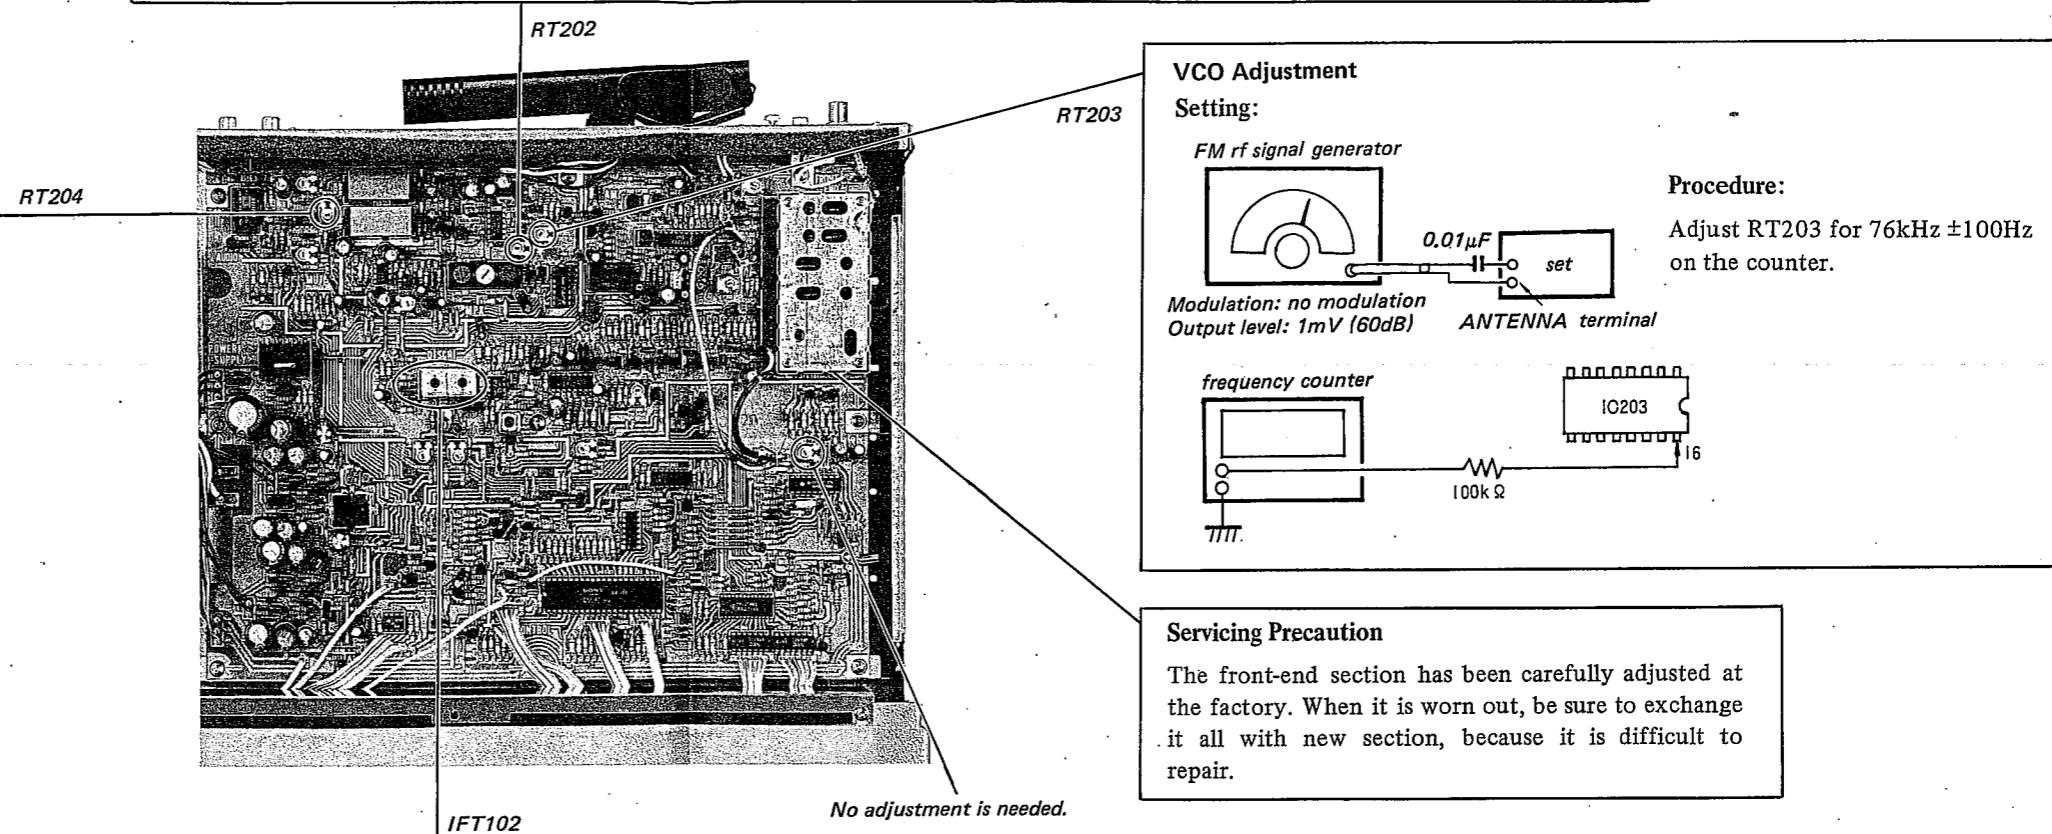

The separations of both channels should be equal.

Pilot Cancel Adjustment

Procedure:

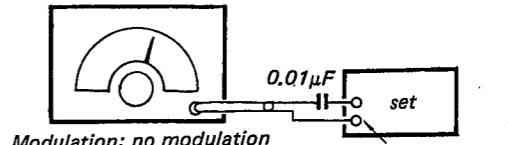

1. Repeat pressing the MUTING button until MUTING LOW indicator lights up.
2. Tune the set to 83MHz by pressing the TUNING switch and turn OFF the audio modulation (400Hz) of the FM stereo signal generator.
3. Adjust RT202 for minimum reading on the VTVM. Output level of both channels should be equal.

VCO Adjustment

Setting:

FM rf signal generator

Procedure:

Adjust RT203 for 76kHz ±100Hz on the counter.

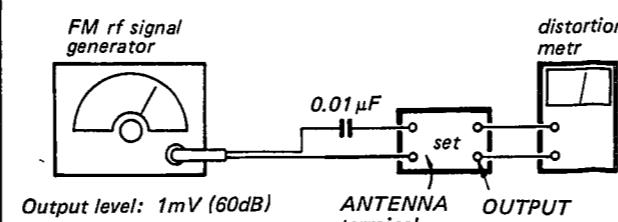

Servicing Precaution

The front-end section has been carefully adjusted at the factory. When it is worn out, be sure to exchange it all with new section, because it is difficult to repair.

Discriminator Alignment

A) Secondary Side

Procedure:

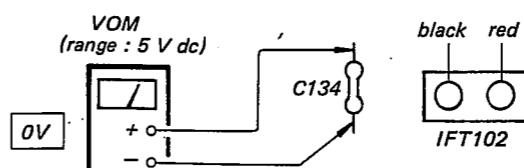

Turn the core (secondary side; black) of IFT102 for minimum distortion reading on the distortion meter.

Note: Repeat both secondary and primary sides adjustments several times.

B) Primary Side

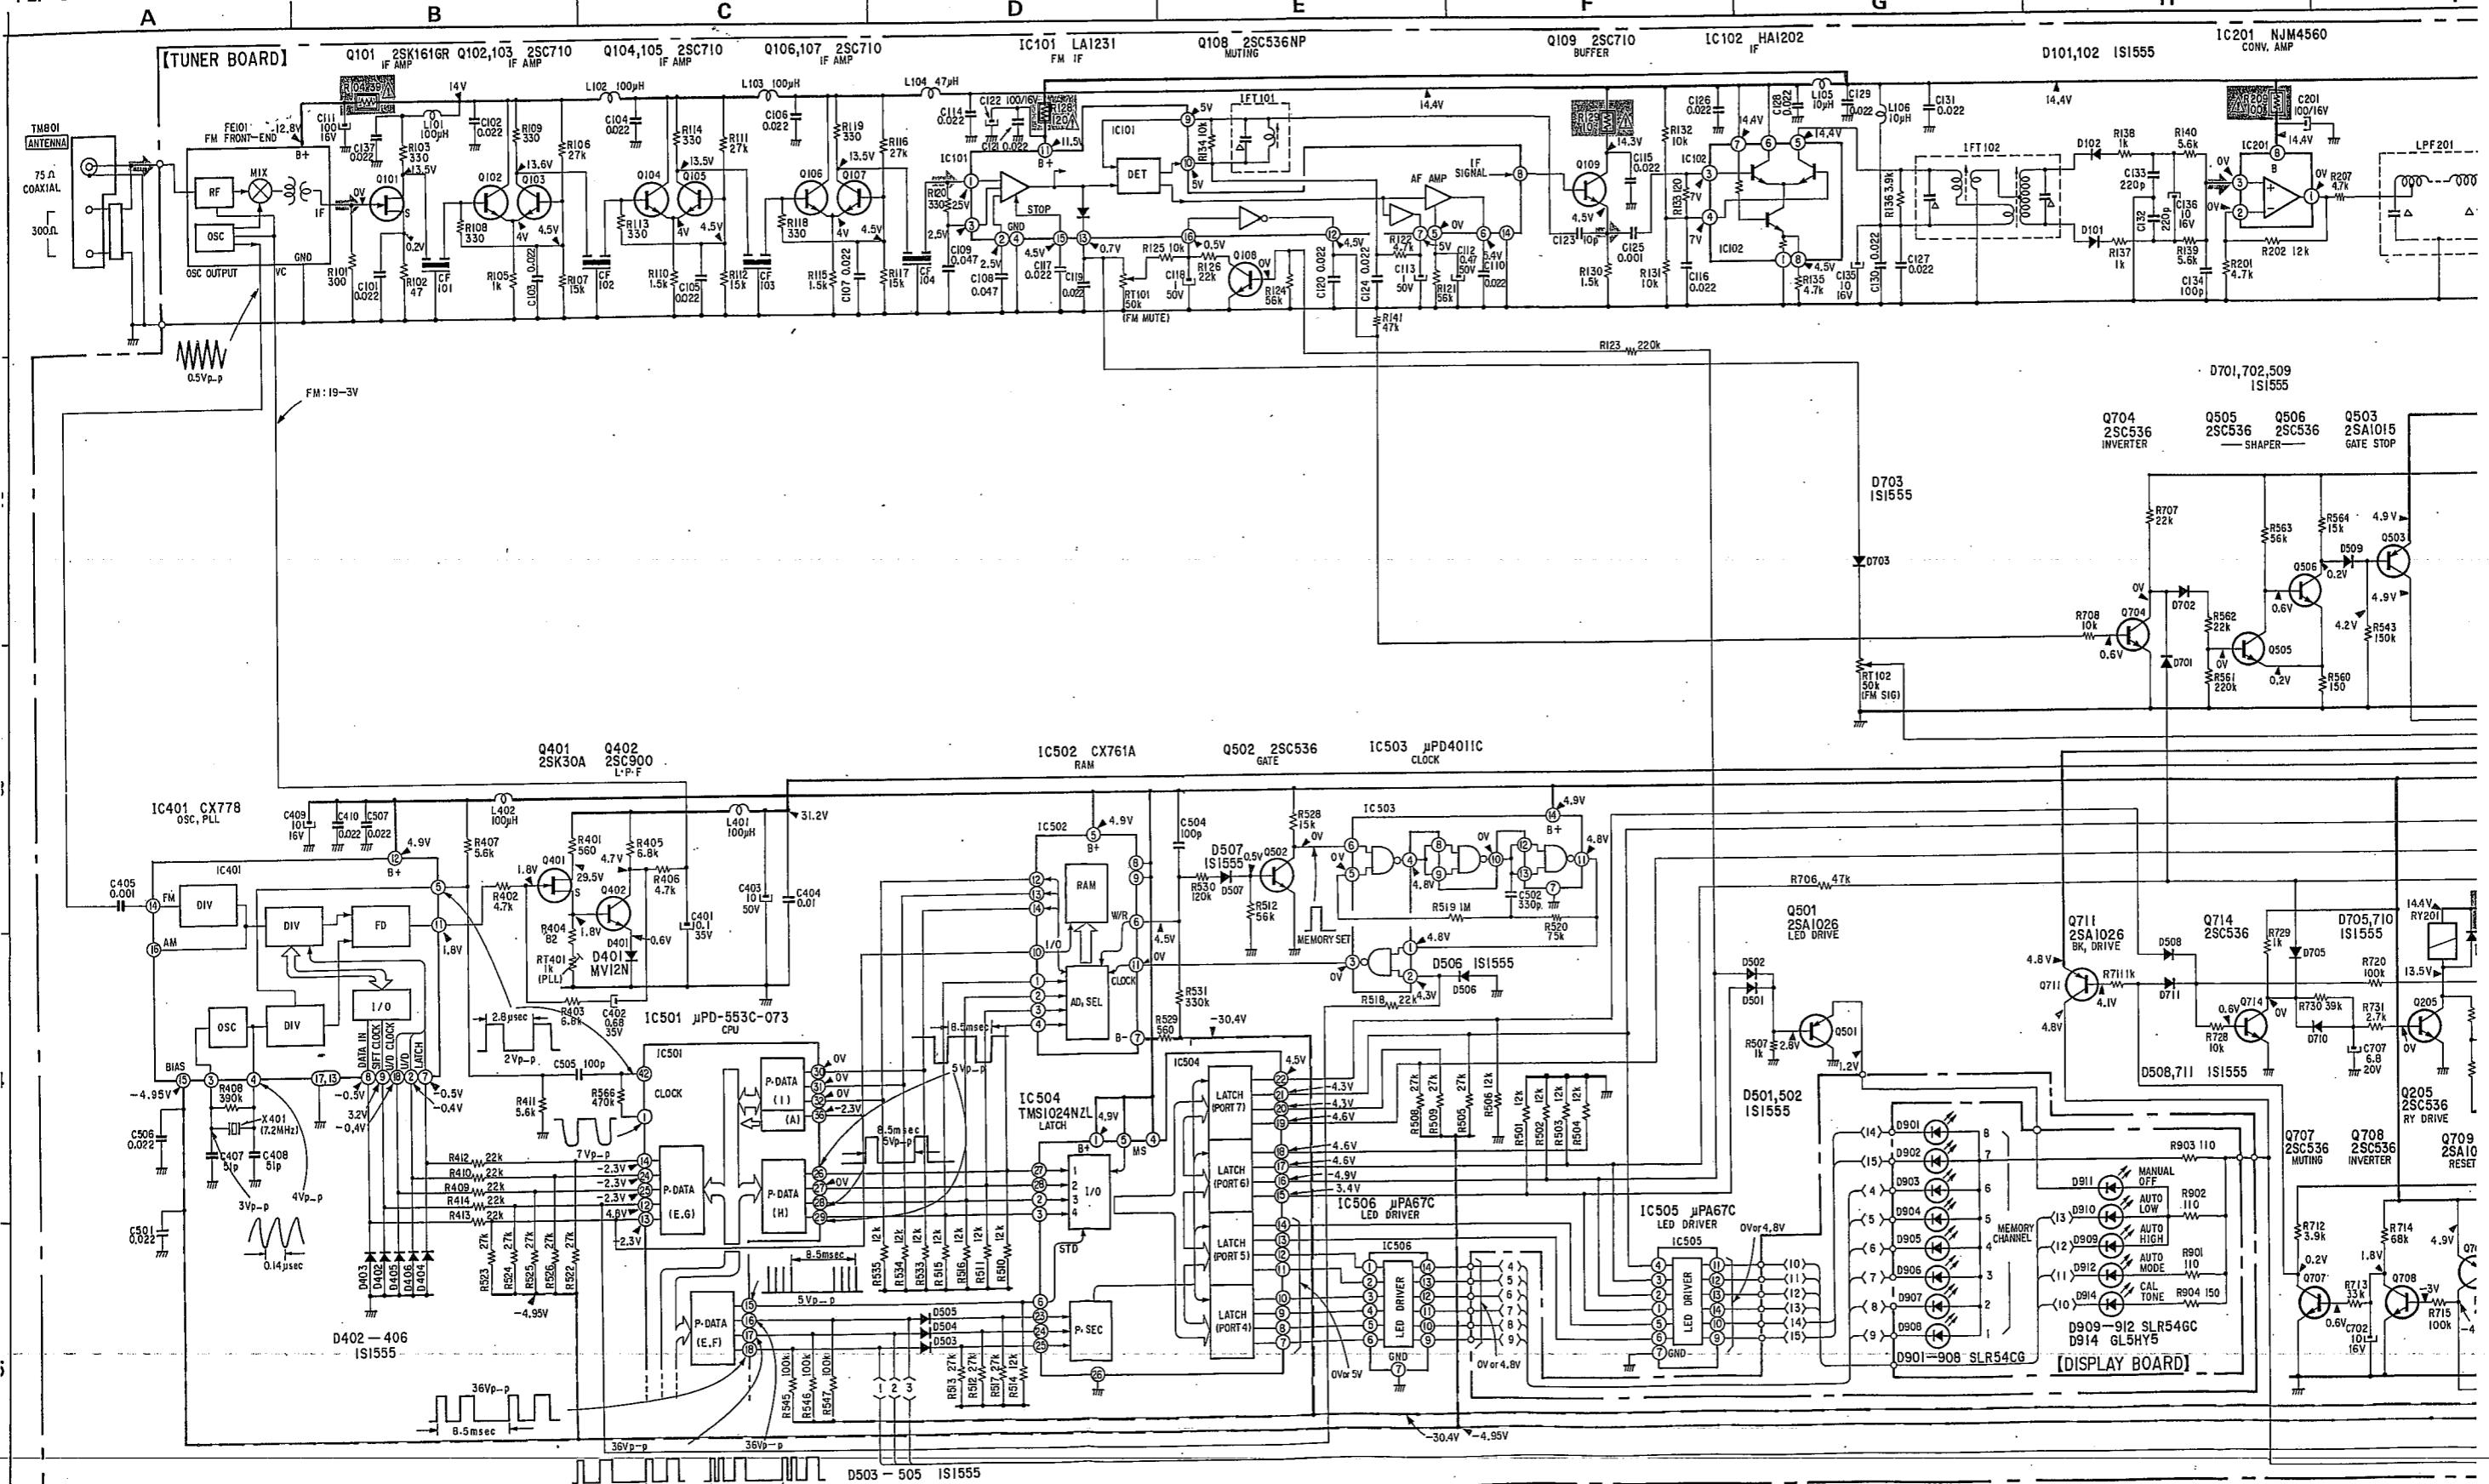

Procedure:

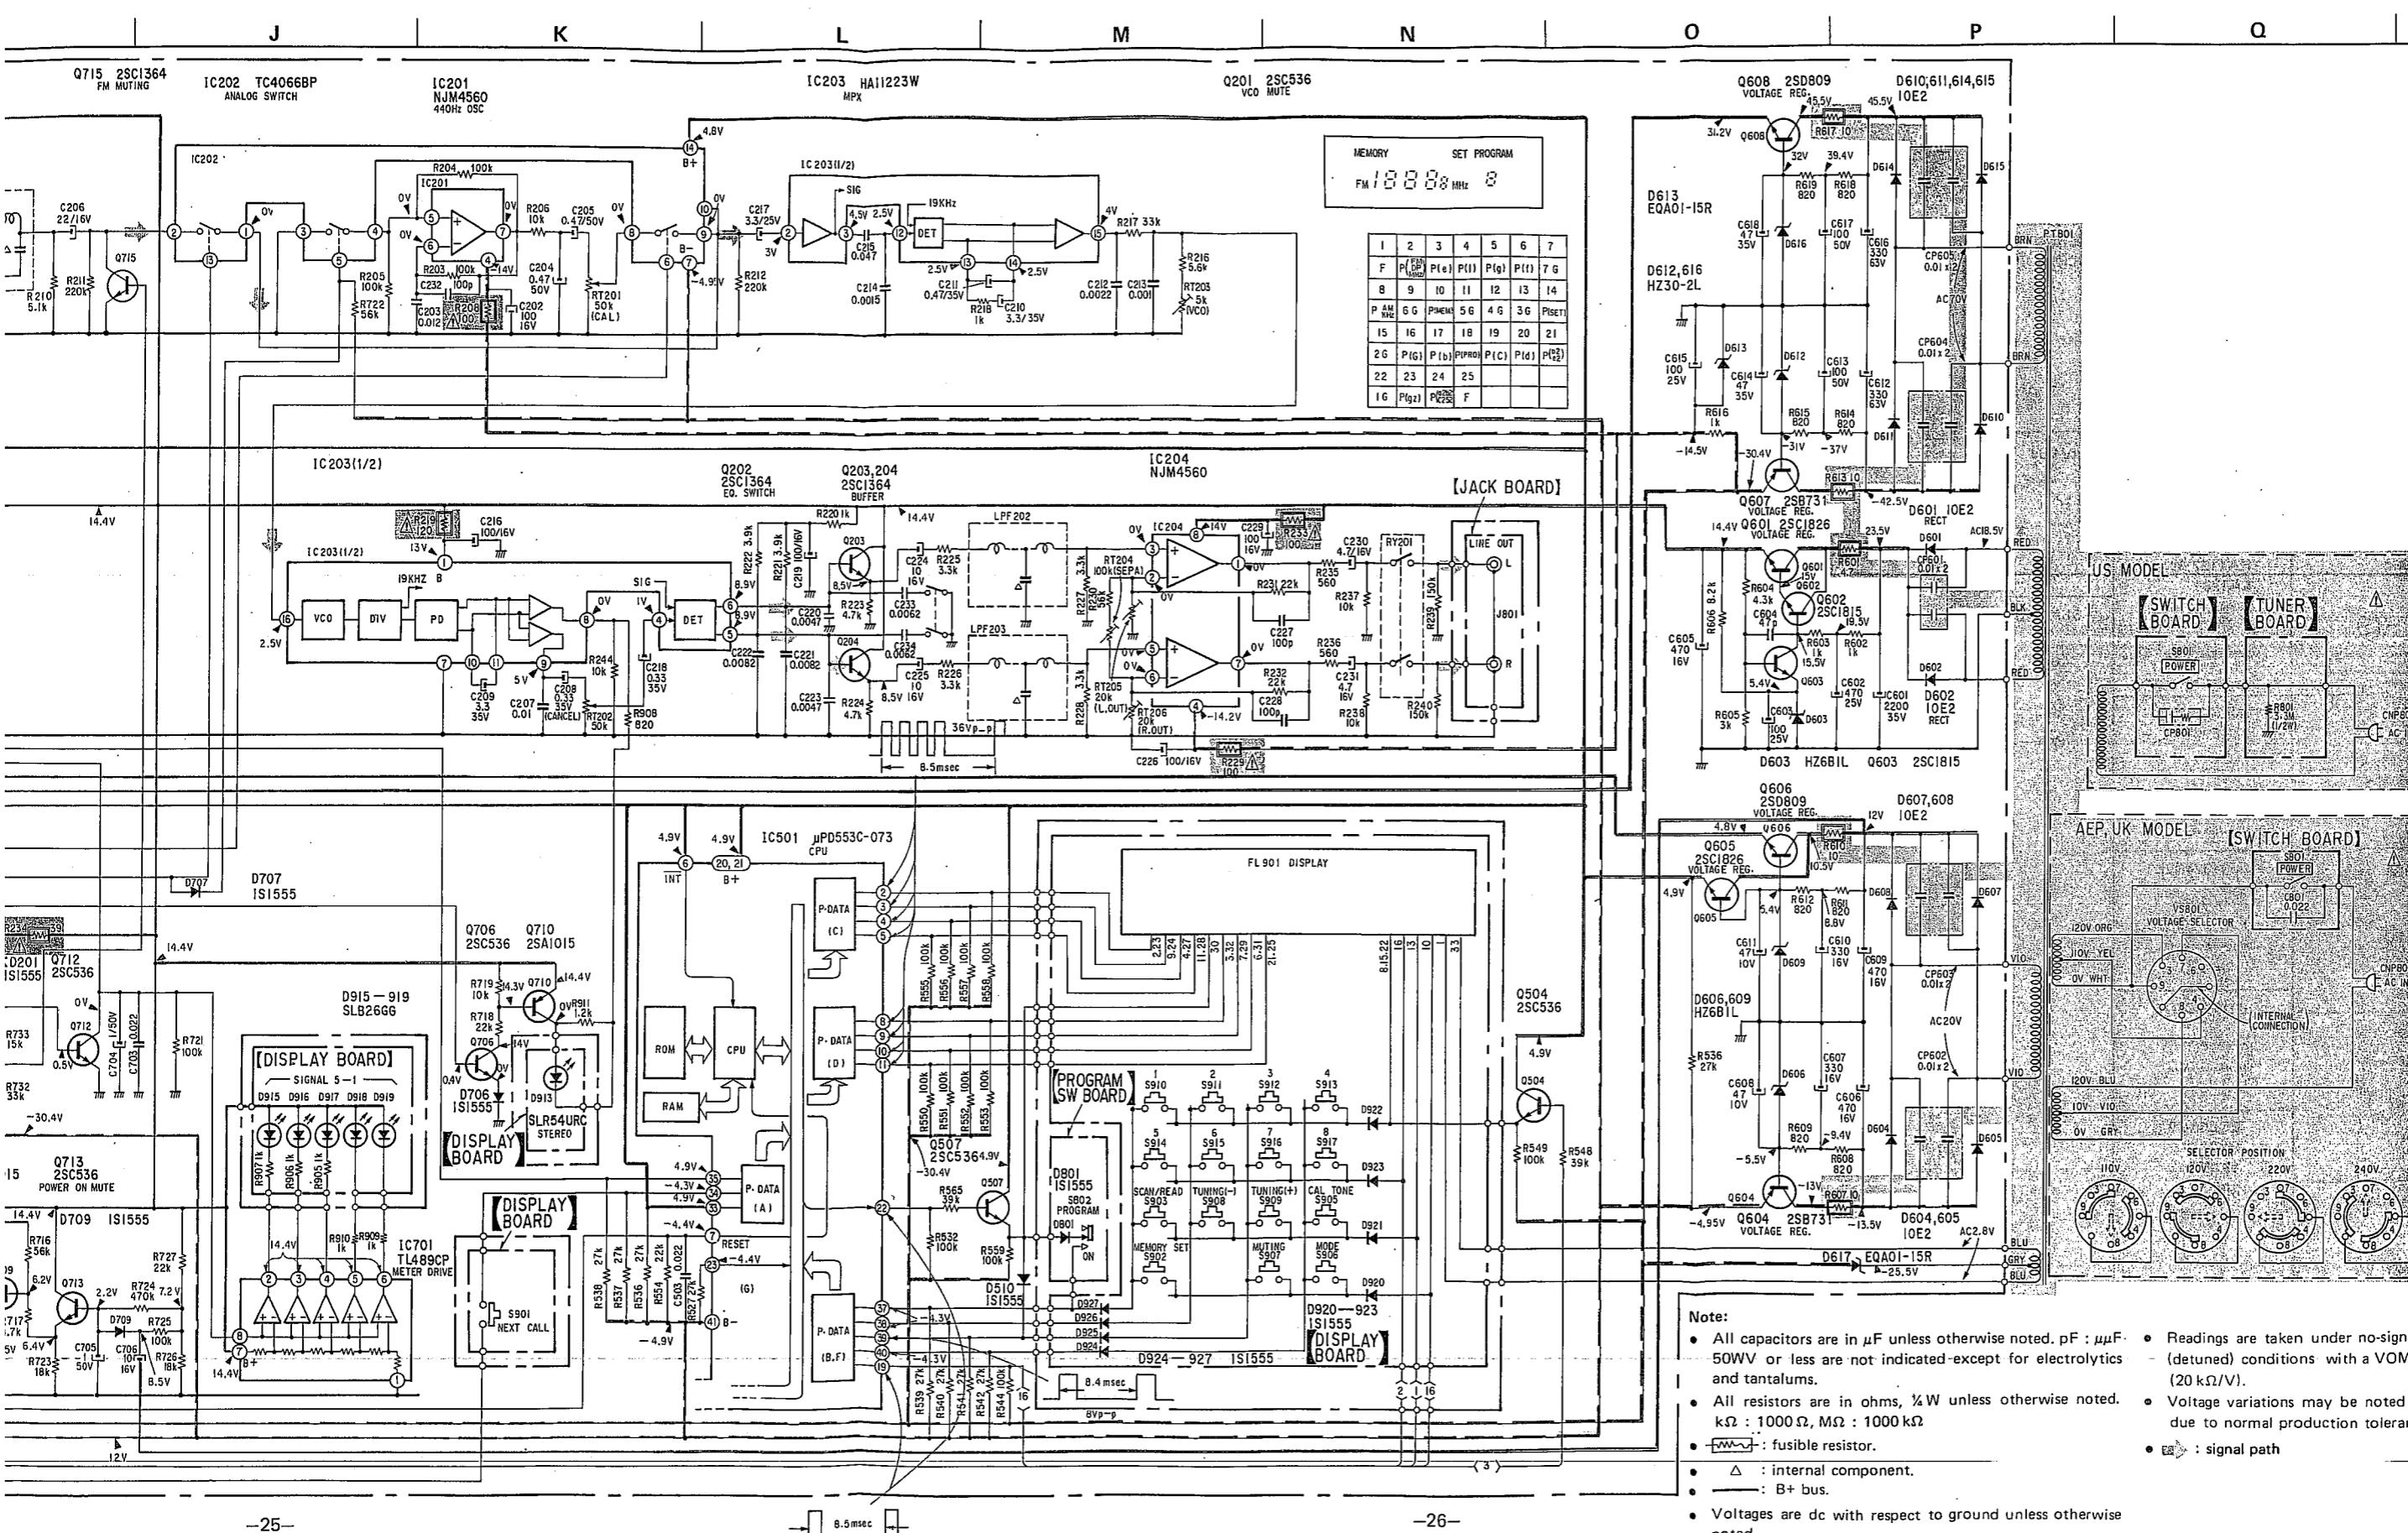

1. Press the TUNING switch to detune the set.
2. Turn the core (primary side; red) of IFT101 for 0V reading on VOM.

Note: When the ceramic filter is replaced, these adjustments should be made.

NOTE:

- Items with no part number and no description are not stocked because they are seldom required for routine service.
- Items marked "♦" are not stocked since they are seldom required for routine service. Some delay should be anticipated when ordering these items.
- Due to standardization, parts with part numbers ($\Delta-\Delta\Delta-\Delta\Delta-XX$ or $\Delta-\Delta\Delta\Delta-\Delta\Delta-X$) may be different from those used in the set.

CAPACITORS:

- All capacitors are in μ F. Common capacitors are omitted. Refer to the following lists for their part numbers.
MF: μ F, PF: $\mu\mu$ F.

RESISTORS

- All resistors are in ohms. Common 1/4W, 1/8W and 1/16W carbon resistors are omitted. Refer to the following lists for their part numbers.
- F : nonflammable

The components identified by shading and mark Δ are critical for safety. Replace only with part number specified.

HARDWARE NOMENCLATURE

Screw: 
 L: Length in mm
 D: Diameter in mm
 Type of head

Indicated slotted-head only.

Unless otherwise indicated, it means cross-recessed head (Phillips type).

Nut, Washer, Retaining ring:

N 3 
 Diameter of usable screw or shaft
 Reference designation

Reference Designation	Shape	Description	Remarks
SCREWS			
P		pan-head screw	binding-head (B) screw for replacement
PWH		pan-head screw with washer face	binding-head (B) screw and flat washer for replacement
PS PSP		pan-head screw with spring washer	binding-head (B) screw and spring washer for replacement
PSW PSPW		pan-head screw with spring and flat washers	binding-head (B) screw and spring and flat washers for replacement
R		round-head screw	binding-head (B) screw for replacement
K		flat-countersunk-head screw	
RK		oval-countersunk-head screw	
B		binding-head screw	
T		truss-head screw	binding-head (B) screw for replacement
F		flat-fillister-head screw	
RF		fillister-head screw	
BV		braizer-head screw	

Reference Designation	Shape	Description	Remarks
SELF-TAPPING SCREWS			
TA		self-tapping screw	ex: TA, P 3 x 10
PTP		pan-head self-tapping screw	binding-head self-tapping (TA, B) screw for replacement
PTPWH		pan-head self-tapping screw with washer face	binding-head self-tapping (TA, B) screw and flat washer for replacement
PTTWH		pan-head thread-rolling screw with washer face	binding-head (B) screw and flat washer for replacement
SET SCREWS			
SC		set screw	
SC		hexagon-socket set screw	ex: SC 2.6 x 4, hexagon socket
NUT			
N		nut	
WASHERS			
W		flat washer	
SW		spring washer	
LW		internal-tooth lock washer	ex: LW3, internal
LW		external-tooth lock washer	ex: LW3, external
RETAINING RINGS			
E		retaining ring	
G		grip-type retaining ring	

Sony Corporation
